Sorry, most of the time that will not work Besides the most basic (native) NET stuff with mono, I do not think you can run a WPF application natively on MacOSX.. Getting the Net app running required using Mono for the underlying engine, which worked well for us as we were only number crunching byte arrays really.

You can try Nevron Open Vision It integrates in WPF, WinForms, Silverlight and MonoMac, Xamarin.. If you think you can make more money by gaining Mac users You might consider using other presentation methods.. Net application, the other a Director projector app The Director app should be easy right, cross platform and all? Well nope, it rarely is that easy, we ended up with two versions of the Director source file.. Visual Studio extensions can now be marked with a Preview label which is shown very clearly on the Visual Studio Marketplace.

The UI on the otherhand we had to rewrite in Cocoa It cost us nearly as much as making the Windows version did, as we also had to learn all the Mac stuff as we went. [موقع تحميل فيديو من اي موقع تحميل اغاني](#)

Another option could be Adobe AIR / Flex If you port your application this way You can maintain a single codebase.. Since then we've only updated the Windows version You want a new feature (support a entire different platform) and you wish to put no effort in it.. This gives your customers clear expectations that this version could contain issues as you are actively developing new features. [Oracle Client Software 7.3 Download](#)

I sell a C#/WPF application (targeting net 3 0 at the moment) and people keep asking me for a Mac version.. When running a wpf control from visual studio 2012 e g Does anyone know of a tool that can run or port C#/WPF to the Mac? We were in a similar situation.. However once you do that your application (or modules) will run on all these platforms from a single code base.. Mac projects This is not like running a WPF application on the Mac, but will rather require you to recode your application on the NOV platform.. Porting the application to a cross-platform UI library, to a different programing language or to Silverlight are all not relevant - it will take too much time and I think I'll get more sales by investing this time in new features.. We had a working Windows project and wanted a Mac version Our product was in two parts, one a.. The application is a time tracking application with a good GUI, there isn't that much business logic in a time tracking application so most of the application is GUI - rewriting just the GUI is equivalent to rewriting the entire application I don't have the resources to rewrite the application or maintain two different code bases, so I need a way to run the same code on a Mac (I know I'll have to debug and modify the code, what I mean is I can support only one code base, I can't split the project into different Mac and Windows projects - I just don't have the time to work on two projects).. Play Parallels: Using Visual Studio on OSX But you won't need this much horsepower to effectively use Visual Studio on a Mac. 34bbb28f04 [Apple Applecare 3 Year Protection Plan For Mac](#)
